The present sequence shows the wild-type urokinase plasminogen activator (UPA). Cyclic peptides based on the amino acids residues 20-30 (the receptor-binding region) of UPA are claimed. These cyclic peptides target the UPA receptor (UPAR), allowing therapeutic or diagnostic agents to be delivered to UPAR-expressing cells The cyclic peptides are used, coptionally when linked to a therapeutic agent, to inhibit migration, invasion and proliferation of cells, or anglogenesis, or to induce apoptosis. Particularly they are used, in human or veterinary medicine, to treat diseases characterized by these processes, e.g. solid tumors, leukaemia or lymphoma (or their metastases); benigh hyperplasis; atherosclerosis; restenosis; ischeemia; deep vein thrombosis; neovascular glaucher cretinopathy; arthritis; fibrosis; bone fracture etc., most particularly growth, invasion and metastasis of tumors. When labeled, the cyclic peptides can be used for diagnostic detection of uPAR (a marker of metastasis) on cells, tissues etc., in vivo or in vitro, and when immobilized they are used to isolate uPAR or cells that express them. The cyclic peptides are stable, soluble in water, bind strongly to attachment of therapeutic or diagnostic agents without significantly affecting their binding. Since they target uPAR, they should have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New cyclic peptide, useful for treatment or diagnosis of e.g. tumors and other diseases involving cell proliferation or migration, targets the urokinase plasminogen activator receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       affecting their binding. Since they target uPAR, they should hav
relatively low systemic toxicity and only low doses are required
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           100.0%; Score 793; DB 3; Length 411;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a composition comprising one or more domains of urokinase-type plasminogen activator (uPA). The composition is used to modulate the contractility and angiogenic activity of a mammalian muscle, endothelial cell or tissue. The composition is used for treating stroke, bypotension, hypertension, atherosclerosis, heart attack, microvascular occlusions, thrombotic microangiopathies, surgically induced thrombotic disorders, angiogenic disorders, pulmonary fibrosis, asthma, tumour cell angiogenesis, tumour cell metastasis, glaucoma, invasion, tumour cell angiogenesis, tumour cell metastasis, glaucoma, olivasion, tumour cell angiogenesis, tumour cell metastasis, glaucoma, classic diabetic refinopathy, wound healing, olotinig disorder, uterine contraction disorder, male impotence, respiratory disease or condition such as asthma, adult respiratory distress syndrome, primary pulmonary hypertension, microvascular thrombotic occlusion, and a disorder sessoriated with chronic intrapulmonary fibrin formation. The present sequence is human urokinase-type plasminogen activator (uPA) two chain curokinase (tcuPA) and single chain urokinase (scuPA) protein

This recombinant single-chain urine-plasminogen activator (scu-PA), is encoded by a structural gene inserted into plasmid pBR332 (from which the infoloom and/or tet resistance genes have been removed), following insertion of a multiple cloning site (see AAQ10281), a terminator and a synthetic Trp promoter. The resultant expression construct can be used to produce high yields of this scu-PA protein which can be refolded to therappeutically active recombinant scu-PA. This is used in the treatment of e.g. cardiac infarction, pulmonary embolism or arterial occlusive disease. (Updated on 25-MAR-2003 to correct PA field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents the modified full length urokinase of the invention, including the whey acid protein (WAP) signal peptide. This sequence had residues 179-184 of the wild type urokinase sequence (see AAW24578) deleted. This modified urokinase cleaves plasminogen, and has lower binding affinity for plasminogen activator inhibitor-1 than the corresponding unmodified urokinase. Urokinase is one of two types of mammalian plasminogen activators (PA), the other being tissue type PA.

PAs catalyse the conversion of the circulating zymogen plasminogen to the broad spectrum protease plasmin by limited proteolysis. The modified urokinase can be used for clot lysis, specifically to dissolve heart attack-causing clots before they cause permanent damage to heart muscle. The urokinase mutant is more resistant to inhibition by plasminogen extivator inhibitors than the unmodified urokinase. It can be selectively expressed and secreted from the mammary glands of transgenic animals. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ઠે
                                                                                                                                                                                     This sequence represents the full length urokinase, including the whey acid protein (WAP) signal peptide. This sequence has residues 179-184 of the urokinase sequence deleted to craste the modified urokinase of the invention. The modified urokinase (see AMX24579) cleaves plasminogen, and has a lower binding affinity for plasminogen activator inhibitor-1 than the corresponding unmodified urokinase. Urokinase is one of two types of mammalian plasminogen activators (PA), the other being tissue type PA. PAS catalyse the conversion of the diroulating zymogen plasminogen to the circulating zymogen plasminogen to the urokinase can be used for clot lysis, specifically to dissolve heart attack-causing clots before they cause permanent damage to heart muscle. The urokinase mutant is more resistant to inhibition by plasminogen captivator inhibitors than the unmodified urokinase. It can be selectively expressed and secreted from the mammary glands of transgenic animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The TPA portion of the claimed hybrid polypeptide (see FT) may consist of x bringles from Vterminal first serine to 219th glycine of human TPA, 1 kringle from 128th serine to 219th glycine to thuman TPA or half a kringle from 161st methionine to 219th glycine (see AAP70257). The C-terminal and for the hybrid polypeptide may contain an AA sequence from 150th glutamine to C-terminal 411th leucine of prourokinase (see AAP70258).
                                                                                                                                                                                                                                                                                                                                                                                                                                                   81 KASTDTWGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDNRRRPWCYVQVGLK 140
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Amino acid modified form of prourokinase - having high fibrin selectively and resistant to cleavage to the two-chain form.
              Hybrid plasminogen activator-like polypeptide - having a region for affinity to fibrin from tissue plasminogen activator and a region from prourokinase.
                                                                                                                                                                                                                                                                                                                                                              1 SNELHOVPSNCDCLNGGTCVSNKYFSNIHWCNCPKKFGGQHCEIDKSKTCYEGNGHFYRG

The amino acid LNS at position 158 of the mature protein is replaced by MET and the amino acid LLE at position 160 is replaced by SER, achieved by site-directed mutagenesis or by chemial modification. The modified PUK has a single polypeptide chain, high fibrin activity and is resistant to cleavage to the two-chain form to an extent greater than its original unmodified form. The therapeutic specificity of single-chain PUK can be increased without decreasing librinolytic activity. The single chain form can have high fibrin activity and thus does not cause general bleeding in
                                                                                                                                                                                                                               81 KASTDIMGRPCLPWNSATVLQQIYHAHRSDALQLGLGKHNYCRNPDNRRRPWCYVQVGLK 140
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Amino acid modified form of prourokinase - having high fibrin selectively and resistant to cleavage to the two-chain form.
     fibrinolytic activity. The single chain form can have high fibrin activity and thus does not cause general bleeding in the body but rather can be localised to the site of the blood clot directly. See also AAN71368-69

The modified PUK has a single polypeptide chain, high fibrin activity and is resistant to cleavage to the two-chain form to an extent greater than its original unmodified form. The therapeutic specificity of single-chain PUK can be increased without decreasing
The modified prourokinase product has a single polypeptide chain, high fibrin selectivity and resistance to cleavage into the two-chain form. The modification is at the codon for Lys158. (Updated on 31-OCT-2002 to add missing OS field.)

The patent is for the prodn. of human single chain urokinase-type plasminogen activator (UTPA). Mutants of scu-PA are especially those which render the protein protease resistant. Such scu-PA mutants are covalently modified at sites of proteolysis by proteases occuring in blood such as thrombin or plasmin, so that thay are no longer susceptable to protease hydrolysis at these locations. The target sites include Lys135 to Lys136 (cleavage at this site generates the so-called low molecular weight form of scu-PA or LUX), Arg156 to Phe157 (susceptible to thrombin attack) and Lys158 to Ile159 (cleavage at this site by plasmin
                                                                                                                                                    KASTDTMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDNRRRPWCYVQVGLK 120

The modified PUK has a single polypeptide chain, high fibrin activity and is resistant to cleavage to the two-chain form to an extent greater than its original unmodified form. The therapeutic specificity of single-chain PUK can be increased without decreasing fibrinolytic activity. The single chain form can have high fibrin activity and thus does not cause general bleeding in the body but rather can be localised to the site of the blood clot directly. See also AAN71368-69

Suitable scu-PA mutants have site specific substitutions, insertions or deletions of residues at one or more of these target sites. Especially preferred are those mutants in which one amino acid residue or both amino acid residues forming the target sites are deleted or in which at least one of these amino acid residues is replaced by another amino acid residue so that the resulting mutants are resistant to proteolytic attack. The UTPA proteins exhibit the blological activity of natural human UTPA without any refolding procedure being or treatment of thrombosis or other conditions where it is desired to produce local fibrinolytic or proteolytic activity. The Arg at position 2 is encoded by TGA(sic). Possible error in the specification. Should read CGA ? The pro-UK gene was derived from plasmid but3. The cDNA was synthesised using urokinase mRNA isolated from a human kidney cell line. Pro-UK was cloned into a SV40 promoter-contg. plasmid ,down - stream of the promoter. This plasmid was then ligated to a DHFR-gene contg. plasmid so that pro-UK and DHFR are inserted in opposite directions. The recombinant plasmid was used to transform CHO-K1 cell derived DHFR gene-deficient host cells to produce glycosylated single-chain pro-UK. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      KASTDIMGRPCLEWNSAIVLQQIYHAHRSDALQLGLGKHNYCRNPDNRRRPWCYVQVGLK 140

         A low mol. wt. polypeptide plasminogen activator (PA) is claimed which is formed from amino acids 150-411 of prourokinase. The preferred intiation region for the low mol. wt. PA is indicated (see FT). A low mol wt. PA can be injected into blood in the body in vivo to dissolve clots without harm. (Updated on 31-OCT-2002 to add missing OS field.) (Updated on 25-MAR-2003 to correct PR field.) (Updated on 25-MAR-2003 to correct PR

                                                                                                                                                                                                                                                                                                             80
                                                                            A human prourokinase (PU) deriv. is new which is based upon residues 2-155 of natural human prourokinase. The new deriv. is produced by E. col 2103/gbwT90_RPK in culture. It is a fast-acting drug for the treatment and prevention of thrombosis. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 25-MAR-2003 to correct PI field.)
Antithrombotic fast-acting pro-urokinase deriv. - produced by culture E coli transformant contg. new plasmid of PMUT9Q family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8
       myocardial infarction. DNA encoding the protein was sequenced from plasmid pCGB195, a subclone of two inserts isolated by screening a cDNA library prepd. From kidney cell RNA. One of the original inserts, clone CGF31 (tag c) started in the middle of the signal sequence. Mutants of the sequence, pref. in which goc (Ala) replaces aat (Asn) at nucleotides 1002-1004 (residue 302) are used to transform hosts for the prodn. of non-glycosylated prourokinase. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         E.coli strain C600SF8 was transformed with recombinant plasmid containing ds DNA derived from human pharynx cancer cell strain Detroit 562. 10000 colonies were screened and one positive clone was identified. Plasmid pUX1 was isolated and found to contain the coding region and 3' non-coding region of pro-UX downstream of Cys(41). Four silent substitutions were identified c.f. Holmes et al., Biotechnology, vol.3, p.923 (1985) as follows: (aic) Asn(254), AAC to AAT; Leu(340), CTA to CTG; Pro(345), CCC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 3, Application US/09880503

Sequence 3, Application US/09880503

Patent No. US2002011964A1

GENERAL INFORMATION

APPLICANT: HIGAZI, Abd Al-Roof

TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR MODULATING MUSCLE CELL AND

TITLE OF INVENTION: TISSUE CONTRACTABILITY

TITLE OF INVENTION TISSUE CONTRACTABILITY

TITLE OF INVENTION UNMER: US/09/880,503

CURRENT FILING DATE: 2001-06-13

PRIOR PELICATION NUMBER: US 60/212,847

PRIOR FILING DATE: 2000-06-20

NUMBER OF SEQ ID NOS: 18

SEQ ID NO 3

LENGTH: 411
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò

Patent No. 5876969

GENERAL INFORMATION:

APPLICANT: Fleer, Rainhard

APPLICANT: Fleer, Alain

APPLICANT: Fleer, Alain

APPLICANT: Jung, Gerand

APPLICANT: Jung, Gerand

APPLICANT: Web, Patrice

TITLE OF INVENTION: NOVEL BIOLOGICALLY ACTIVE FOLYPEPTIDES,

TITLE OF INVENTION: CONTAINING SAID POLYPEPTIDES

ITLLE OF INVENTION: CONTAINING SAID POLYPEPTIDES

NUMBER OF SEQUENCES: 36

CORRESPONDENCE ADDRESS:

ADDRESSEE: Rhone-Poulenc Rorer Inc.

STREET: 500 Arcola Road, 3C43

CITY: Collegeville

STATE: PA

COUNTRY: USA

Sequence 83, Application US/08720012

Patent No. 5747291

GENERAL INFORMATION:

APPLICANT: STEPFENS, GERD J.

APPLICANT: SCHNEIDER, JOHANNES

APPLICANT: ALINEL OF INVENTION: BIFUNCTIONAL UROKINASE VARIANTS WITH

TITLE OF INVENTION: BIFUNCTIONAL UROKINASE VARIANTS WITH

TITLE OF INVENTION: IMPROVED FIRENCLYTIC CHARACTERISTICS AND THROMBIN

TITLE OF INVENTION: IMPROVED FIRENCLYTIC CHARACTERISTICS AND THROMBIN

TITLE OF INVENTION: IMPROVED FIRENCY

NUMBER OF SEQUENCES: 83

CORRESPONDENCE ADDRESS:

ADDRESSEB: Evenson, McKeown, Edwards & Lenahan

STREET: 1200 G Street, N. W. Suite 700

CITY: Washington, D.C.

CONTRY: Washington, D.C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 SKTCYEGNGHFYRGKASTDTMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPD 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..

MEDIUM TYPE: Ploppy disk
COMPUTER: IBM PC compatible
OMPRATING SYSTEM: PC-DOS/MS-DOS
OPERATING SYSTEM: PC-DOS/MS-DOS
OOFTWARE: Patentin Release #1.0, Version #1.30 (EPO)
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/560,098A
FILING DATE: 17-NOV-1995
PRIOR APPLICATION DATA:
APPLICATION NUMBER: P 44 0892.7
FILING DATE: 17-NOV-1994
ATTORNEY/AGENT INFORMATION:
NAME: BANS, Joseph D.
NAME: BANS, JOSEPh D.
